#### **DETAILED ACTION**

### Response to Amendment

1. This in response to amendment filed 01/08/2009. No claims have been added. No claims have been canceled. No claims have been amended. Claims 1-15 are still pending in this application.

## Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kimoto et al. (US PAT # 5,241,533) in view of Munguia (Pub.No.: 2004/0233933).

Regarding claim 1, Kimoto teaches a method for transmission over packet networks, the method comprising: detecting, at a first node at least one next node (the detecting limitation is obvious if not inherent, without detecting a destination node no packet will be transmitted to that node); creating a channel between the first node and the at least one next node (the claimed channel is obvious if not inherent. The claimed channel can be the channel between any two nodes such as C and B or E and F, see Fig. 1); receiving, at the first node, a first packet (see col. 3, lines 18-20); detecting a

protocol of the first packet (detecting the protocol of the first packet is obvious within the teachings of Kimoto).

Kimoto does not specifically teach "merging the first packet with a second packet of the same protocol" and "transmitting the merged first packet...etc".

However, Examiner now introduces Munguia which teaches a method and device for having a plurality of packets that have a particular protocol combined and merged to a single packet of the same protocol (see abstract and Fig. 1)

Thus, it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the feature of merging packets into one single packet, as taught by Munguia, into the Kimoto system in order to provide an enhanced VOIP quality.

Claims 4, 10 and 15 are rejected for the same reasons as discussed above with respect to claim 1. The claimed "interface" as recited in claim 10 is inherent as well as the claimed "processor" and "port". The claimed "threshold" as recited in claims 4 and 15, see col. 4, lines 5-31. Also, for the claimed feature of "splitting a packet", the Examiner believes that this limitation if obvious and well known in the art. One of an ordinary skill in the art may choose to merge packets or split packets based on the need and desire. This limitation does not rise the invention to the level of patentability.

Regarding claims 2-3 and 14, having the first and the second packet containing circuit-based information is obvious. One may choose to have the packet containing any type of information desired. Thus, this is considered a design choice that does not rise to the level of patentability.

Regarding claims 5 and 7, this limitation is obvious because one of an ordinary skill in the art may choose the threshold to be at any desired level. On one hand, one can set the threshold to be the minimum quality. Other can choose the threshold to be the maximum quality. On the other hand, the threshold in Kimoto is set for failure and redundancy purposes.

Regarding claim 6, Kimoto teaches rejecting a communication related to the first packet (this may read not being able to transmit the packet to one node due to temporary concentrated traffic for example, see col. 3, lines 35-43).

For claims 8 and 12 limitations, this is obvious one may choose to have the node to be is an existing media gateway or any other element.

For claims 9, 11 and 13, Kimoto teaches node is connected to a circuit-switched voice network (see abstract).

# Response to Arguments

3. Applicant's arguments have been considered but are moot in view of the new ground(s) of rejection.

### Conclusion

4. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Rasha S AL-Aubaidi whose telephone number is (571) 272-7481. The examiner can normally be reached on Monday-Friday from 8:30 am to 5:30 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ahmad Matar, can be reached on (571) 272-7488.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
